Driver and Vehicle Licensing Department (DVLD) System

Overview

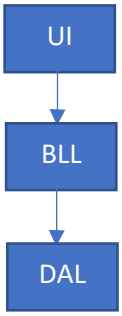

The **Driver and Vehicle Licensing Department (DVLD) System** is a desktop application I developed during my second year as an IT student. As my first major project managing complex business logic and real-world transactions, I built it following the **Programming Advices** roadmap under the mentorship of Dr. Mohammed Saqer.

The system digitizes core government licensing workflows, including driver applications, tests, license issuance, and error logging—all built on 3-tier architecture, OOP principles, and scalable design.

Technologies & Stack

- **Language:** C#
- **Framework:** .NET Framework (Windows Forms)
- **Data Access:** ADO.NET (Parameterized Queries / DataTables)
- **Database:** Microsoft SQL Server

Architecture

3-Tier Architecture: Structured with a strict separation of concerns across decoupled layers:

Main Features

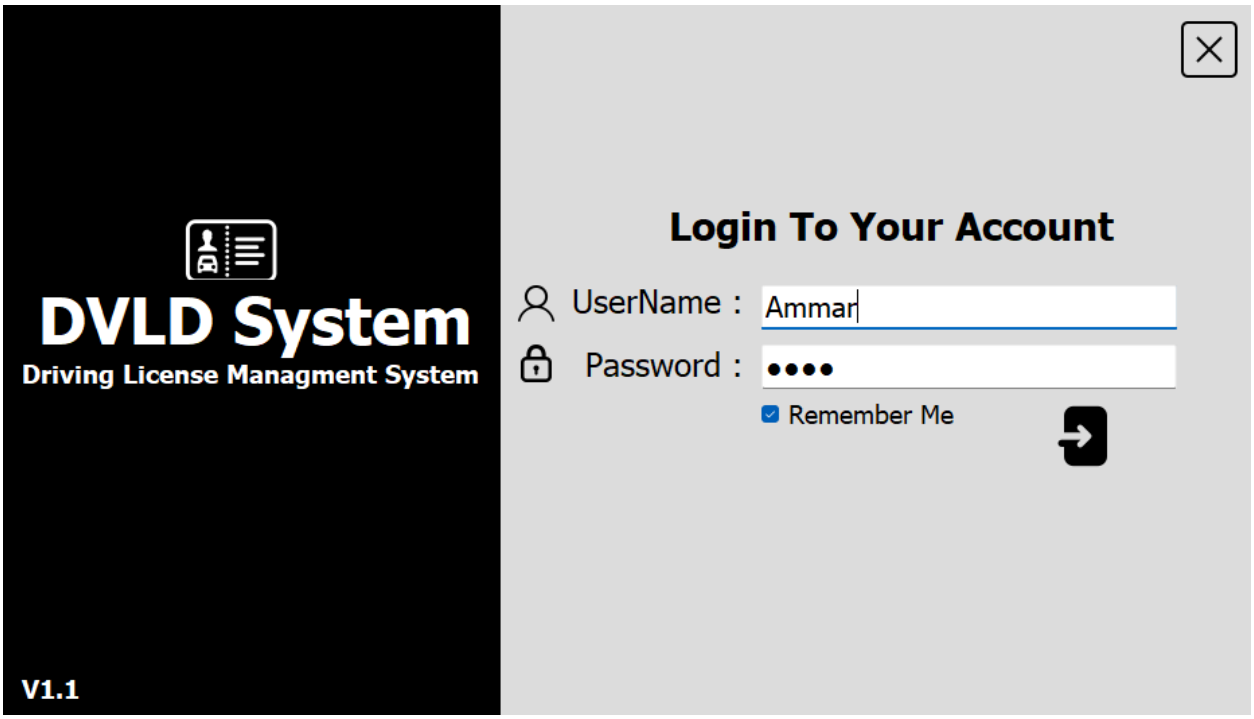

1-**Users & Security:** Secure login system with encrypted password hashing .

2-**Applications Management:** Streamlined workflow for managing driver applications, scheduling appointments, and fees.

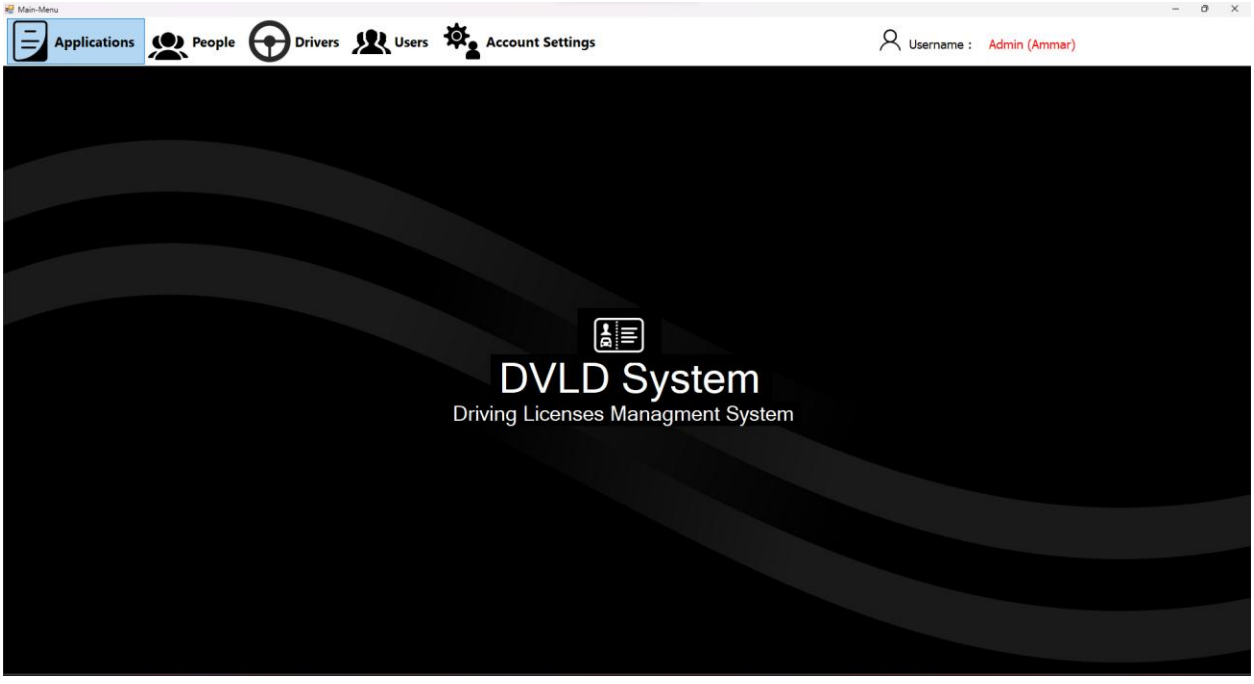

3-**Testing & License Issuance:** tracking for all 3 core tests (Vision, Written, Practical) and instant license issuance.

4- **Detain & Release System:** Efficient handling of license detentions, fine payments, and release procedures.
